

Lack of Brick Maintenance

This is an Example of a Brick Building with Multiple Problems

This brick building has had a lack of brick maintenance (tuckpointing), which will be more costly to repair now. By letting a building get in this condition there is a good chance that there will be damaged wood behind the brick that may have to be replaced because of it constantly being moist do to water seepage through the mortar joints and there could be structural damage to your wood studs, also there will most likely be damaged brick because of the fall to the ground, which will have to be replaced. Don't put off having your building tuckpointed or it may end up looking like this. Also notice the side door entrance that used to be a window. The contractor did a poor color match tuckpointing job. This contractor's workmanship shows a lack of pride in their work. Don't be fooled by "Fly by Night Contractors".
